1 Introduction

1.1 Purpose

The purpose of the QA Plan is to define the processes, methods and tools that will be used to develop the OpenETCS project meeting ITEA requirements, following Open Source principles and practices and applying the SCRUM Methodology. Besides, two of the project outcomes, the OpenETCS software, the OpenETCS Tool Chain, will have to comply with CENELEC requirements.

Due to the nature of the OpenETCS project (R&D EU project with a complex list of project outcomes and deliverables), the QA Plan is specifically designed to provide a complete, consistent and integrated view of the development process at both project and product level (i.e. the development life-cycle is described partially in two different deliverables, the QA plan should manage to provide an integrated view).

The QA Plan also describes the activities to monitor and manage quality in all aspects of the project:

- Defining and ensuring that all processes and products are compliant with the corresponding standard and requirements, according to the required system/software safety integrity level
- Identifying nonconformances
- Providing timely quality status feedback to management and affected personnel
- Ensuring noncompliance issues are addressed

Therefore, it describes the QA functions, responsibilities and specific monitoring and control activities.

1.2 Goals of the openETCS project

The main goals and deliverables of the OpenETCS project are:

- Creating a formal specification of the ETCS OBU functionality according to UNISIG Subset 026
- 2. An executable software package generated from the formal specification and a non-vital implementation of that software for laboratory test, simulation and reference purposes
- 3. A tools chain supporting both previous bullet points including code, test case and document generation meeting CENELEC EN50128:2011 (T3) requirements and certifiable for SIL4 software applications for signalling equipment (Certification itself is not part of the project)

1.3 Intended Audience

The QA Plan addresses all the stakeholders who are in the position to interact with OpenETCS project

| Audience | Use | Role |
|---|--|--|
| OpenETCS Consortium Members | It provides information and access to the QA procedures and guidelines to be followed/applied during the different phases of the project development life-cycle. It provides a consistent and integrated view of the development process followed. | Consultation Reviewer Contributor or Committer |
| OpenETCS Quality Manager | It contains the quality targets to be achieved and the corresponding QA activities to be implemented and monitored. | Author |
| CENELEC Assessors | It shows the SQA strategy conceived and the one effectively implemented | To assess whether the project results comply to CEN- ELEC standards |
| Open Source Community (Users, Adopters, Contributors, Committers) | Provision of information and access to the QA related procedures and guidelines implemented. Provision of information on the on-going projects Provision of guidelines on how to participate to any of the projects | For consultation and/or engagement |
| ITEA Representa- tive | The QA Plan constitutes a Project Deliverable | For evaluation |

Table 2. Intended Audience

1.4 Evolution

The first version of the document, prepared at the beginning of the project, will be updated regularly with the evolution of the OpenETCS project. The methods and tools to be applied during the development of the OpenETCS software products will be decided based upon the results of the research activities carried out during the project.

The QA Plan document will incorporate such decisions as they are taken with a proper justification of their appropriateness to meet the quality targets. The QA manager will guarantee the document is up to date.

The QA Plan document has been conceived as a reference document. This means that detailed descriptions of procedures, guidelines, methods and/or tools will not necessarily be included in the document but adequately referenced (*chapter 1.5*). The authors of such documents and/or Wiki pages will be responsible for keeping them updated. The QA manager will monitor such activities and will guarantee changes are appropriately reflected in the QA Plan, when appropriate.

The QA Manager will maintain the QA Plan backlog [4] [Wiki].

Major revisions of the QA Plan will be accomplished by the Committers to the Management Project. Minor review process will be done with the participation of the external community, following procedure [8]

| Abbreviation | Meaning |
|--------------|---|
| ASR | Assessor |
| CCS | control-command and signalling subsystems |
| DES | Designer |

Table 8 – continued from previous page

| Abbreviation | Meaning |
|------------------------|--|
| Abbieviation | European Rail Traffic Management System |
| ERTMS | Train signalling system equipment based on a single Europe-wide standard for train control and command systems. |
| ERA | European Railway Agency |
| ETCS | European Train Control System It is a signalling, control and train protection system designed to replace the many incompatible safety systems currently used by European railways |
| EUPL | European Union Public Licence |
| EVC | European Vital Control |
| GSM-R (train radio) | Global System for Mobile Communications - Rail(way) It is an international wireless communications standard for railway communication and applications. |
| HR | Highly Recommended |
| HW | Hardware |
| IMP | Implementer |
| INT | Integrator |
| MVB | Multifunction Vehicle Bus It is a part of the Train Communication Network (TCN), and it takes part in digital operation in the train. MVB is the bus part in each coach, and the Wire Train Bus (WTB) allows connecting the MVB parts with the train control system. |
| NA | Not Applicable |
| OBU | On-Board Unit |
| PMP | Project Management Plan |
| REQ | Requirements Manager |
| R&D | Research and Development |
| SCMP | System Configuration Management Plan |
| SIL | Safety Integrity Level |
| SME | |
| SRS | Software Requirements Specification |
| SW | Software |
| SW-SIL | Software-Safety Integrity Level (EN 50128:2011) |
| TSI | Technical Specification for Interoperability |
| TST | Tester |
| VAL | Validator |
| VER | Verifier |
| V&V | Verification and Validation |

Table 8 – continued from previous page

| Abbreviation | Meaning |
|--------------|-------------------------------------|
| WP | Work Package |
| FM | Formal Methods |
| IP | Intellectual Property |
| IP Clean | No IP without permission in writing |

2 Project Organization

OpenETCS is a cooperative European-ITEA project. The project plan (objectives, work plan schedule, role of the partners, project organization) is described in the [20] FPP document, which is updated regularly (at least yearly). The project is accomplished according to the Project Co-operation Agreement (PCA) [14] signed by the partners.

The organization of the project has to meet the following constraints and challenges to succeed:

- 1. As an ITEA project, the project has to meet requirements imposed by the ITEA Office that affect both the organization and the outcomes of the project.
- 2. As an ITEA project, the effective involvement of the partners is sometimes hampered by external constraints (i.e. local financing, local approvals) so mechanisms to guarantee the "required competence" is available when needed are to be implemented. Besides, OpenETCS operates in a regulated environment where demonstrating the competence of the personnel assigned to the different activities is required.
- 3. Some of the results (software & tool chain) have to be certifiable; CENELEC SIL4 requirement [6] have to be followed and the corresponding evidence provided.
- 4. As an open source project, Open Source principles will be respected; high degrees of engagement from the community are intended.
- 5. As it is the intention to apply SCRUM, the appropriate responsibilities and mechanisms have to be implemented

The following chapters shows the mechanisms implemented at organizational level to guarantee the above mentioned objectives are achieved.

2.1 openETCS project organisation

Figure 1. OpenETCS Project Structure

2.1.1 Compliance with ITEA Requirements

ITEA rules are documented in the ITEA2 Frame Agreement [XX].

Compliance to ITEA Requirements is achieved by means of:

- The appointment of a Project Coordinator (DB, WP1, supported by the Project Office) who leads the project and is responsible for the communications with the ITEA representatives.
- The appointment of a Local Coordinator per country, National Cluster Leader, who reports to the corresponding National Authorities of the progress of the local partners
- A signed PCA where cooperation rules and principles and working structures are agreed by all the partners.
- An OpenETCS Foundation NV which guarantees sustainability of the project results once the project is finished.

2.1.2 Compliance with Open Source Principles

Compliance to the Open Source Principles and related objectives is achieved by means of:

- An OpenETCS IP Policy and Procedures [13]
- An OpenETCS Development Process [17] [Wiki] based in the Eclipse Development Process [2], designed to promote dynamism in the development and openness. All the guidelines are maintained and available at the OpenETCS Ecosystem project [XX]:

 The OpenETCS project is conceived as a project of projects organized in a hierarchical manner, where the WorkPackages, as defined within the WorkProgramme [20], are considered Top-Level Projects with their own charter. The so-called Tasks are projects, sub-projects of the corresponding Top-Level Project.

- Anyhow, new projects can be launched, if needed and approved; existing projects can
 be archived, if they become inactive. Therefore the final structure of the OpenETCS
 project will very much depend on its evolution.
- The list of OpenETCS projects with information on their status is available in [XX]
- Any project (independently to its position in the hierarchy, and type) has its project leader, scope and maintains its own resources. The project leader is not only responsible to guarantee progress towards the scope of the project but to promote that the most appropriate community is engaged in the project life-cycle with openness and transparency. This community includes committers, contributors, users and adopters.
- Every Top-project/WP has its own repository under the responsibility of the Top-Project/WP Leader. Agreements and principles on the repository structure and content can be found in [XX]
- The PMB (Project Management Board) is responsible for maintaining and assuring the implementation of the OpenETCS Development Process and for ensuring the required "coordination" among the projects.
- The Mentoring board (composed of XXX) is responsible for mentoring projects and advising.
- The Project Office is responsible for the administrative tasks around the OpenETCS Development Process and maintains the OpenETCS Ecosystem project [XX]
- The tools to support the OpenETCS Development Process are open source tools. A relation of the tools approved by the consortium is [XX]
- The engagement of the OpenETCS Advisory Group will not only provide valuable technical insights but visibility of the project within the railway community.

2.1.3 Compliance with SCRUM Requirements

Agile Project Management has been introduced to software projects in the 90-ties and is now a de-fact industry standard well documented in publications as e.g., in [XX].

Compliance to SCRUM Requirements is achieved by means of

- Each Work Package/Top-Project Leader is the SCRUM Product Owner of the corresponding WP/Top-Project results and maintains the corresponding backlog
- Each Project/Task Leader is the SCRUM Product Owner of the corresponding Tasks results and maintains the corresponding backlog
- The Project Coordinator is the SCRUM Product Owner of the project results and maintains the project results backlog.
- Weekly meetings are maintained to find and report on impediments, assess progress, promote cross-collaboration, plan next steps and therefore, maintain the corresponding backlog.
 - Weekly Scrum meetings are per definition open meetings, e.g., everybody from the teams can participate and contribute to the meeting.

- The weekly meetings are strictly time-boxed.
- At WP/Project level, the registered committers, contributors, users and adopters are invited to participate
- At Open ETCS project level, the components of the PMB(Project Management Board) are invited.
- The work-packages resp. tasks need to organize there scrum teams according to practical needs.
- Teams are typically distributed in geography and in organisation (i.e., participating companies).
- Scrum teams typically have to provide several development roles (according to CENELEC and according to Eclipse). Guidance on the possible mixtrues of CENELEC roles into a Scrum team is documented in the annex section of this guideline.
- To be able to be successful in Agile Development we need to set special focus to the role of the "User" of a product.
 - In general, the user of a product in openETCS should representratives of the project openETCS consuming the result of a scrum team.
 - The workpackage leader of the WP using an outcome of the team is the first candidate.
 - Representatives of partners making use of the openETCS result in long term are also natural users of a team result.
 - Partners in the openETCS project need to agree on the Users before the task when planning the interfaces.
- Each team has to select a scrum master. Scrum training is mandatory.
- A SCRUM master (WP1) is responsible for supporting the teams.

2.1.4 Compliance with software management and organisation according to EN50128:2011

In principle, two of the OpenETCS project results (Software and Tool Chain) are to be CENELEC SIL 4 certifiable. These are two of the results from WP3 and WP7. The following mechanisms, at organizational level, will help the corresponding project leader to provide evidence of compliance with chapters 5.1 [1] and 5.2. Anyhow, evidence that requirements imposed are met will have to be provided for each of the two software projects on a project by project basis.

- Every partner in the consortium is ISO9001 Certified or will be in the position to provide evidence of a quality management process is accordance to ISO9001
- Every partner maintains an updated CV of the staff/experts involved in OpenETCS
- A Required Competence Matrix (RCM) per role and project will be maintained (Chapter 4).
- A database with the participants per role and task/project will be maintained by the task/project leader.
- Overall, the independence required to develop certifiable results is promoted by the Work Programme which is structured into the following "independent" WorkPackages/Top-Projects, each lead by a different organization.

- WP2, focused on Requirements Specification is led by SNCF.
- WP3, focused on the Software Implementation taking as input WP2 and WP7 results is led by Alstom France.
- WP4 focused on the specification of the V&V structure, is led by DLR
- WP5 focused on demonstrating applicability/validity of WP3 and WP7 results is led by ERSA
- WP7 focused on the development of the Tool Chain is led by DLR taking as input WP2 and WP4 inputs
- For the purpose of validating/adapting technical approaches, tools and concepts before they are taken into consideration, three Use Cases will be engaged.
- The Open Development Process facilitates the creation of the necessary projects required to achieve the OpenETCS project results.
- For each assessable result, CENELEC required software roles will be covered by experts
 from different WPs. Incompatibilities can be controlled and monitored as active participation
 to the different projects has to be granted, accepted and is appropriately registered (*Chapter*2.2). Evidence of competence can be provided by comparing the CV of each expert with the
 RCM for the role assigned.
- For each assessable result, if possible, the role of the assessor will be selected from the external community of the project. Meanwhile, an internal independent assessor will be appointed. The role and profile of this assessor is detailed in OpenETCS/internal-assessment [12] [wiki pages]

One of the mechanisms to guarantee the availability of competence staff when needed will be the design and implementation of a training programme. The training programme will be managed by the Project Office. The identification of needs will be performed by the project leaders, the PMB and the Quality Manager. The training process is detailed in [XX]

2.2 Committers assignment and responsibilities

Each Top-Project/WP leader is responsible for establishing and publishing the specific required competence matrix for the Top-Project/WP (*Chapter 4*). This matrix will be updated in response to the demands imposed by the evolution of the project. The competence matrix template [22]is provided in [XX]

Each Top-Project/WP leader is responsible for developing the most appropriate communities of users, adopters, contributors and committers as required by the Top-Project/WP. A database will be maintained and assessed periodically by the Top-Project/WP Leader. This database will contain the coordinates of the expert, his/her role in the project and a basic explanation of adequacy. The expert database template is provided in [XX]

The required core competences as well as the expected contribution of each of the identified communities are described in Chapter 4.

Only committers have write-access to the project resources. Becoming a committer requires of the acceptance of the project leader and of the rest of the project committers. Guidelines on how to become a committer can be found in [ecosystem wiki pages].

• It is the responsibility of the Project Leader to make sure the required competence to develop a task is covered by the engaged committers.

• It is the responsibility of the Open ETCS Project Leader to guarantee the required competence for the project is covered by the effective committers.

Contributors have read-access to the project resources, and acceptance is not required. Guidelines on how to become a contributor can be found in [ecosystem wiki pages].

An expert can contribute to different projects with different roles. The data from different project will be integrated and analysed to detect potential incompatibilities, if applicable. This activity will be done by the QA Manager. The guideline on how to select expert is detailed in [XX].

2.3 Project QA Management

QA activities will be under the responsibility of the QA Manager, who reports to the Project Coordinator.

The QA Manager will be responsible for the identification, supervision and control of all the processes, methods and tools required to meet the quality targets of the project. It is also the responsibility of the QA manager to provide the necessary evidence that such activities have been developed.

The activities of the QA Manager will be:

- To maintain the OA Plan and associated procedures and guidelines.
- A QA Plan Backlog will be maintained, implemented and published
- To participate in the OpenETCS Ecosystem project in cooperation with the Project Office
- To perform periodical audits of the maturity of the different on-going projects; propose improvement actions, if necessary.
- To participate in the review processes of the different work products.
- To collaborate with the Project Office in the identification of gaps and in the development of the corresponding Training Programme.
- To perform quantitative and qualitative analysis at process and product levels. To maintain a set of metrics for all the processes.
- To produce and publish the corresponding quality reports.

3 Life Cycle

The openETCs project itself is a R&D project running over 3 years which has the goal to deliver products such as the on-board specification model and the corresponding tool chain to generate source code based on this model. While the project life cycle is limited through the project time span, the products shall be used and also developed further after the end of the openETCS project. Respectively, the project only presents the firth development part of the product life cycle.

3.1 Project Life Cycle

The project Life Cycle is implemented through a set of WPs broken down into Tasks. In response of the nature of the project, these WPs are grouped into three purpose driven categories. The first category (WP2, WP4) addresses the specification of the work to be developed and the validation of the results to be obtained; the second category (WP3, WP7, WP5) addresses the development itself and the demonstration of the software and the tools chain developed and the third category (WP1, WP6) addresses the project management, the quality assurance and the dissemination of the project. This structure permits both the development and the integration of conceptual (R&D) and implementation activities to achieve innovative, validated and fit-for-purpose results. The detailed description of the Work Package description and overview plan is covered by [FPP].

3.2 Product Life Cycle

As the OpenETCS project products shall be part of the train development the reference for their life cycles are the CENELEC standard phases defined in the EN50126. But as the products are in general R&D results, their life cycles do not include any certification or acceptance activities at the moment. The main OpenETCS products are the OpenETCS Software model and the OpenETCS tools chain development, which have their own life cycles. For both parts the main development, verification and validation activities are done during the OpenETCS project. For the software only the demonstrator implementation is part of the OpenETCS project, while any kind of implementation on a target hardware is out of the project. For the OpenETCS tools chain the basic implementation is part of the project, but all further steps from qualification on are out of the project. In general long time maintenance is a key concept of these products but it can not be established in the project time span.

3.2.1 Life Cycle of the OpenETCS Software

The software development life-cycle of the OpenETCS project should be complied with CEN50128. Requirements imposed by the standard are analyzed and shown in detail in D2.2, while the software development life cycle applied in this project is described in Deliverable 2.3 and D2.4. The Test and Validation activities are presented in D4.2. The integration, the assessment and any maintenance is only defined in relation to the demonstrator implementation as no further phase can are planed in depth at this point.

3.2.2 Life Cycle of the OpenETCS Tools chain

The development of the Tool Chain has to comply with EN50128. Requirements imposed by the standard are analyzed and shown in detail in D2.2. The tools chain development life cycle is described in D7.3. As the tools chain is a combination and improvement of already existing tools, which have a specific life-cycle, the tools chain life cycle mainly consists of integration and maintenance activities.

3.3 QA Management

Guidance: Refer to the procedures to implement the QA activities identified within the above mentioned development life-cycle.

CC: The parts \$2.3 (Project QA management) and 3.3 (QA management) could be both in the same part (2 or 3). For us, the Quality Assurance has to refer to both project life-cycle and Software life-cycle.

IT: In chapter 2.2, the idea is to introduce the QA Organisation Roles (both project and software, as you say). In chapter 3.3 we will explain the QA activities

4 Roles

4.1 OpenETCS Roles

In view of the nature of the project, roles are grouped into three independent categories:

• CAT1: Open Source Development Process Roles

CAT2: SCRUM Roles

• CAT3: CENELEC Roles

Therefore, any participant will always adopt a role within CAT1, a role within CAT2 and if he/she is involved in the development of a CENELEC assessable product, a third role in CAT3.

As already mentioned, OpenETCS is a project of projects. An expert can participate to different projects with different roles. Therefore an expert will have a CAT1, CAT2 and/or CAT3 role per project.

In the Annexes A, B, C and D, the responsibilities and the core competences required by each role are detailed. It is the responsibility of the QA Manager to keep them updated

In the case of CAT 1 roles, specific technical competence will be required depending on the scope of the project. For this reason a new column has been added. In this column, specific technical competences for each project and role are to be included. It is the responsibility of each project leader to provide this information.

According to the open development process followed by Open ETCS, the QA process is also a project. For this reason the QA Manager will have to meet the competences of a Project Leader and the specific competences imposed by CENELEC and the OpenETCS project to the Quality Manager activities. When needed, specific responsibilities imposed by a project to a role will be detailed too.

As project results affected by CENELEC are already identified, both core and specific required competence per CAT 3 role are included in Annexes C and D.

4.2 Roles within the Development process of the openETCS Software

The responsibilities and competences for every role specific to the openETCS Software development are listed in Annex C. The independence of different roles is the core concept of the quality

assurance strategy required be CENELEC standards. As openETCS is a collective project by various independent partners, the project organization already ensures full independence between the roles administrated by experts from different partners.

4.3 Roles within the Development process of the openETCS Tools Chain

See Annex D

4.4 QA Activities

The QA Manager will be in charge of:

- Maintaining the Requirements Competence Matrices updated in response to the evolution of the OpenETCS project
- Performing periodical audits of the participants' database per project; trace database with the RCM (Required Competence Matrix) for such project
- Identify training needs and provide the required support to the Project Office in the definition and organization of the corresponding training activities.
- In the case of CENELEC related project, provide the necessary evidence of competence and independency between roles. If this is not possible, propose the necessary solutions and support the projects in its implementation

5 Methods, measures and tools for quality assurance (product + open ETCS software + Tools chain)

Selection of methods and tools used in each phase of the OpenETCS process is a part of the WP7 activities. This selection is based on the state of art established by WP2 (D2.1 and D2.2), the set of requirements defined by WP2 (D2.6-9) and the process definition (D2.3, D2.4, D4.1, D4.2.3).

Results of the selection of methods and tools are given in the D7.1 and D7.2 deliverables. Conformance of the methods and tools are going to be discussed in D7.3.

The following table give details of all this deliverables.

| Deliverable | Content of Relevance for this Chapter |
|--|--|
| D2.1: Report on | State of the out on motheds and tools |
| existing methodologies | State of the art on methods and tools |
| D2.2: Report on CENELEC Standards | CENELEC requirements to be fulfilled and the approach followed by the project to provide evidence |
| D2.3: Process definition | OpenETCS process definition |
| D2.4: Report on Methods definition | Description of methods and tools to use to follow the OpenETCS process |
| D2.6-9: Set of requirements for the OpenETCS project | Definition of the requirements that the selected methods and tools shall follow |
| D4.1: Report on V&V Plan & Methodology | Detailed description of the V&V process and how are used the methods and tools to cover V&V artifacts |
| D4.2.3: Safety Plan | Detailed requirements on methods and tools to be used during the process to obtain a SIL4 development of on-board unit |
| D7.1: Report on the final choice(s) for the primary tool chain (means of description, tool and platform) | Selected methods and tools to be used during the specification and design part of the OpenETCS process |
| D7.2: Report on all aspects of secondary tooling (results of T7.2) | 1 1 1 |
| D7.3: Tool chain qualification process description | This report describe how the selected methods and tools fit the qualification requirements according CENELEC standard |

Table 9. Referenced deliverables

5.1 Methods, measures and tools for quality assurance OpenETCS Application Software

It is assumed that the OpenETCS application software will be SIL4 compliant. Therefore, the methods, techniques and tools shall be suitable to SIL 4.

MPD(Systerel): It is not totally exact: one of the aim of the project is to provide a tool chain which allows to develop SIL4 software, the OpenETCS application software produced during the project has not as objective to be SIL4 compliant.

MPD(Systerel): The current OpenETCS process, and the selection of methods and tools, do not cover only software development but also system phases as described in EN50129 or EN50126.

5.2 Methods, measures and tools for quality assurance openETCS Tools chain

The Tool Chain will be composed of a set of tools with different levels of interaction. The document D7.3 provides a description of the Tool Chain architecture, jointly with a description

of the constituent tools. Following CENELEC criteria, each tool belongs to one of the following classes: T1, T2 and T3. Class 3 and Class 2 Tools are obliged to follow specific development methods, techniques and tools.

5.3 Quality Control and Monitoring Activities

Guidance: Describe the measures to monitor the appropriate implementation of the selected methods and tools.

JW: This is a broad topic, the main issues will be covered by the verification, validation and safety plan. This aspect should introduce the general principals and tools and then reference those documents.

IT: OK. I think there is an error in the template. Instead of QA Activities, it is Quality Control and Monitoring Activities.

6 Documentation

The documentation structure of the OpenETCS project is composed of:

- Deliverables, which constitute the official outcomes of the different Top-Projects/WPs
 - The relation and scope of the deliverables to be produced along OpenETCS can be found in the FPP [].
 - The updated status of development of each Deliverable can be found in [State-of-Deliverables Wiki].
 - The approved and therefore valid version of each Deliverables can be found in the repository of the Top-Project/WP it belongs to.
- Contractual documents, with the Commission and among the project partners
 - The status of development of each contractual document can be found under the repository of Management (WP1).
 - The last approved and therefore valid version of each contractual document can be found under the repository of Management (WP1).
- Periodic Progress Reports, to show progress to ITEA and EC representatives.
 - The state of each Periodic Report can be found under repository of Management (WP1).
 - The last approved and therefore valid version of each Periodic Progress Report can be found under the repository of Management (WP1).
- Supporting Documents, in the form of Templates and Procedures
 - The procedures and templates applicable to a specific Top-Project/WP can be found in the repository of the corresponding TP/WP.
 - The procedures and templates applicable to the whole project can be found in the repository of Governance.
- Internal Reports, in the form of Meeting Minutes
 - The minutes of the weekly scrum meetings are found in the repository of Governance.

The nomenclature used for the naming of the different documents is provided in [XX-to be developed].

For each TP/WP the relation of existing documents is provided in the form of a list [Wiki]. This list includes a direct access to the valid version of each document.

6.1 Documentation Structure within the development process of the openETCS Software

As a SIL4 software, the documentation structure has to comply with CENELEC requirements. The following table shows the document structure required by CENELEC for a SIL4 development and the corresponding documents produced in the OpenETCS project.

Table 10. Documentation Structure

| Document | ation S | tructure within the development process of t | he openETC | S Software |
|---|---------|--|-----------------|-----------------|
| Phase | SIL4 | Document | WP/Task | Link |
| Planning | HR | Software Quality Assurance Plan Software Quality Assurance Verification Report Software Configuration Management Plan Software Verification and Validation Plan | (to be defined) | (to be defined) |

6.2 Documentation Structure within the development process of the openETCS Tools chain

Guidance: See Chapter 6.1

6.3 Quality Control and Monitoring Activities

Guidance: Describe the methods to review the documentation structure

JW: For me this should not be the review of the documentation structure, but the documentation quality control activities. These are looked at in detail over the next to chapters, therefore this should be a general overview.

T: OK

7 Documentation Control

Guidance: Refer to Control Process Document where the function develop by authors, reviewers is provider

JW: This sentence is hard to understand. From my point of view the three section make no sense since there should be the same process for all kinds of documents. This section should name the main control activities (review, approval, dissemination, archiving) and the main tools used for this. Then it should refer do the respective documents (like the great review process).

IT: OK, we will clarify this sentence.

7.1 Documentation Control within the Development process of the openETCS Sotware

Guidance: Refer to the list of active documents of the openETCS software

7.2 Documentation Control within the Development process of the openETCS Tools chain

Guidance: Refer to the list of active documents of the openETCS tools chain

7.3 Quality Control and Monitoring Activities

Guidance: Describe the methods to monitor both the control and process

8 Tracking and tracing of deviation

8.1 Traceability (openETCS software + Tools chain)

Guidance: Provide a description of traceability requirements, as well as how the traceability will be achieved, implement, maintained and verified. At this stage, exceptions if they exist should be justified.

8.2 Configuration Management

Guidance: Refer to SCMP (System Configuration Management Plan). Overview table with the summary of main features of SCMP.

JW: SCMP has to be written. This mainly includes an explanation of the proper github working processes.

IT: OK, it will be included in the backlog we are preparing.

Describe the QA activities

8.3 Fault Management

ISTQB define a defect as "a flaw in a component or system that can cause the component or system to fail to perform its required function". A defect can be random or systematic. A defect, if encountered during execution, may cause a failure of the component or system". From the ISTQ glossary bug, fault and problem are defined to be the same as a defect.

A failure is a deviation of the component or system from its expected delivery, service or result. A failure is the consequence of a fault or error in a system but not all faults result in failures.

Faults, failures and errors encountered during the review activities (QA. Verification, Validation, Assessment) planned in the software development life-cycle, problems reported by users and customers as well as change requests initiated by any of the system stakeholders will be reported and managed following the Change/Problem Management Process [3] detailed in [XX] and through the Change/Problem Management Tool. This tool will be integrated with the Configuration management tool *GIT* and will be configured to implement and record all the information generated during the process.

The integration with the Configuration management tool *GIT* will permit:

- Traceability between Change/Problem Requests and the configuration items where the problem was located.
- Traceability between the configuration items modified and the corresponding Change/problem request.

The implementation of the workflow will permit:

• A complete history trail of the Change Request/Problem Report

The purpose of the Change/Problems Management implementation at OpenETCS project is to ensure that standardized methods and procedures are used for efficient and prompt handling of all changes/problems associated with the OpenETCS products, in order to minimize the number and impact of any related changes/problems. Changes/problems in the products may arise reactively in response to incidents, or proactively from seeking improved efficiency and effectiveness, as well as to enable or reflect OpenETCS initiatives, or products improvements.

The QA Manager will be in charge of:

- perform periodical audits and quality assessments of the bugs received
 - Audits to verify the process itself
 - Quality Assessments to verify the evolution of the product quality
- Assist in determining QA impacts
- Support Problem owner in analysis

8.4 Grievance Handling

Guidance: Refer to the specific procedure.

Describe the QA activities

8.5 Modification and change control

A change is the addition, modification, or removal of a configuration item (CI), product, or product component, and/or its associated elements

The change requests initiated by any of the system stakeholders will be reported and managed following the Change/Problem Management Process [3] detailed in [governance] and through the Change/Problem Management Tool.

The Change/problem Management process aims to evaluate and plan the change/problem process to ensure that, if a change is made, it is done in the most efficient way possible, following the established procedures and ensuring the quality and continuity of the OpenETCS project and products at all times.

The QA Manager will be in charge of:

- perform periodical audits and quality assessments of the change request received
 - Audits to verify the process itself
 - Quality Assessments to verify the evolution of the product quality
- Assist in determining QA impacts
- Support Change owner in analysis

9 Supplier Control

Guidance: Requirements to external suppliers and how they will be verified

JW: What are the suppliers in OpenETCs and what activities are needed here?

IT: It is only to be considered if any supplier is needed

describe the QA activities to be developed.

JW: Im missing sections for the Quality Assurance during the product maintenance and the deployment of the software and the tool chain.

IT: Product Maintenance and deployment phased will be covered in Chapter 3.2

ANNEXES

10.1 ANNEX A -CAT1: Open Source Development Process Roles and Competence Matrix-

Table 11. CAT1: Open Source Development Process Roles/Competences

| CAT1: Open Source Development Process Roles/Competences | Responsibilities (To be revised) Core Competences Specific Competences /Responsibilities per project | Responsible to guarantee progress Promote that the most appropriate community is engaged in the project life-cycle Ensure that all personnel involved in all phases of the software, tool chain (products) and project life-cycle, including management activities, have the appropriate training, experience and qualifications To be fulfilled per project Software, tool chain (products) and project life-cycle, including management activities, have the appropriate training, experience and qualifications | Make sure the required competence to develop a task is covered by the engaged committers To ensure that all personnel who have responsibilities for the software are competent to discharge those responsibilities To be fulfilled (To be fulfilled) (To be fulfilled per project) Ensure that the parties involved throughout the product life-cycle are independent, to the extent required by the software safety integrity level, in accordance with cenelec | |
